## 2. Test Sites

### 2.1 Test Facilities

TÜV Rheinland Japan Ltd. - Global Technology Assessment Center  
4-25-2 Kita-Yamata, Tsuzuki-ku, Yokohama 224-0021, Japan

The used test equipment is in accordance with CISPR 16 for measurement of radio interference.

The Federal Communication Commission has reviewed the technical characteristics of the radiated and conducted emission facility, and has found these test facilities to be in compliance with the requirements of section 2.948 of the FCC rules.

The description of the test facility is listed under FCC registration number 299054

The Industry Canada has reviewed the technical characteristics of the radiated and conducted emission facility, and has found these test facilities to be in compliance  
The description of the test facility is listed under O.A.T.S filing number 3466B.

### 3. General Product Information

#### 3.1 Product Function and Intended Use

The **EUT (Equipment Under Test)** is a IEEE802.15.4 radio unit, which is to be connected via a serial data interface to measurement tools, e.g. caliper. Data from the measurement tool are transmitted via the EUT to a remote PC. The measurement tools are not part of the EUT. The EUT has a proprietary connector and can be connected only to measurement tools, not to any other digital devices or PCs.

#### 3.2 System Details

Radio Standard:	IEEE 802.15.4
Specified power output:	-3dBm (max. peak power: 0.5mW)
Antenna gain:	+2 dBi
Antenna type:	Chip antenna
Mounting type:	Internal
Frequency range:	2405 – 2475 MHz
Number of channel:	15
Channel spacing:	5 MHz
Modulation type:	DSSS, OQPSK (single fixed data rate)
FCC Classification:	DTS
Emission Designator:	G1D
System Input Voltage:	DC 3.0V (CR2032 Lithium Battery)
Typical Nominal Voltage:	DC 3.0V (CR2032 Lithium Battery)
Protection Class:	III

### **3.2.1 Antenna Requirements FCC 15.203, FCC 15.204 and RSS-210 A8.4**

**RESULT:****PASS**

The EUT has an internal antenna which is not user accessible. Hence it complies with the requirements.

### **3.3 Clock Frequencies**

The EUT generates internally following clock frequencies:

4 MHz
16 MHz

### **3.4 Independent Operation Modes**

The system was configured for testing in a typical fashion (as a customer would normally use it).

The justification and manipulation of cables and equipment in order to simulate a worst-case behavior of the test setup has been carried out as prescribed in ANSI C63.4: 2003. Testing was performed at the lowest operating frequency (2405 MHz), the operating frequency in the middle of the specified frequency band (2440 MHz) and the highest operating frequency (2475 MHz).

The basic operation modes are:

- A. EUT transmits (TX mode), with full power, at lowest Channel (2405 MHz), modulation ON, continuous data streaming with 100% duty cycle.
- B. EUT transmits (TX mode), with full power, at middle Channel (2440 MHz), modulation ON, continuous data streaming with 100% duty cycle.
- C. EUT transmits (TX mode), with full power, at highest Channel (2475 MHz), modulation ON, continuous data streaming with 100% duty cycle.
- D. EUT receives (RX mode), on middle Channel (2440 MHz), continuously.

### **3.5 Noise Suppressing Parts**

None mentioned explicitly.

## 4. Test Set-up and Operation Modes

### 4.1 Test Methodology

The test methodology used is based on the requirements of 47 CFR Part 15 (2007-04-05), sections 15.31, 15.33, 15.35, 15.205, 15.209 and Measurement of Digital Transmission Systems Operating under Section 15.247.

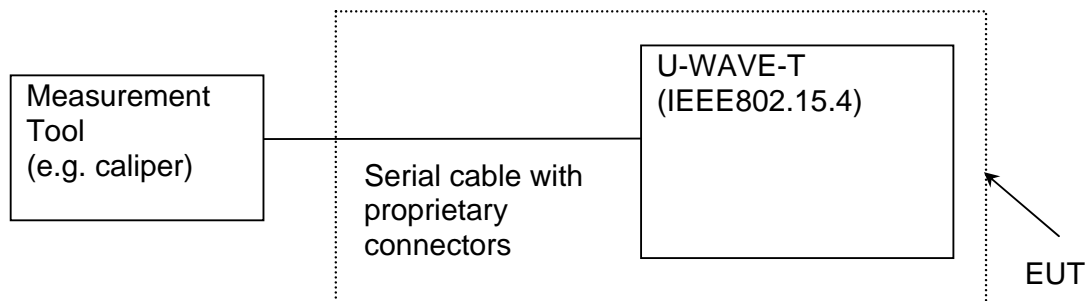

The test methods, which have been used, are based on ANSI C63.4: 2003 and RSS-Gen.

Details see under each test.

### 4.2 Physical Configuration for Testing

Refer to section: Photographs of the Test Set-Up

**Figure 1: Test setup**

For conducted tests, the antenna was replaced by a 50Ω antenna connector.

### 4.3 Test Operation and Test Software

Software used for testing: N/A

The EUT had built-in test modes.

The EUT was exercised in the operation modes listed under 3.3 as appropriate.

#### **4.4 Special Accessories and Auxiliary Equipment**

The product has been tested together with the following additional accessory

- |                |                             |
|----------------|-----------------------------|

## 5. Test Results Conducted Testing At Antenna Port

For conducted tests, the antenna was replaced by a 50Ω antenna connector.

### 5.1.1 Conducted Output Power at Antenna Terminals FCC 15.247(b)(3) and RSS-210 A8.4

**RESULT:**
**PASS**

Date of testing: 2008-02-20

Ambient temperature: 24.0 °C

Relative humidity: 24 %

Atmospheric pressure: 1010hPa

Requirements:

For systems using digital modulation in the 2400-2483.5MHz band the maximum peak output power is 1 watt (30 dBm).

Test procedure:

ANSI C63.4-2003, RSS-Gen 4.8 and Measurement of Digital Transmission Systems Operating under Section 15.247.

The maximum peak output power (conducted) was measured directly (without additional cable) at the antenna connector with the power meter.

The EUT was connected to a DC power supply with a voltage of 3.0V simulating a full battery.

## Requirements:

For systems using digital modulation in the 2400-2483.5MHz band the minimum 6dB bandwidth shall be at least 500 kHz.

## Test procedure:

ANSI C63.4-2003, RSS-Gen 4.6.2 and Measurement of Digital Transmission Systems Operating under Section 15.247 March 23, 2005

The output connector is connected to a spectrum analyzer. The spectrum analyzer resolution bandwidth was set to 1% of the SPAN (10MHz). The 6dBc Bandwidth was measured by using the DELTA MARKER function of the analyzer.

The EUT was connected to a DC power supply with a voltage of 3.0V simulating a full battery.

### 5.1.4 Conducted Spurious Emissions FCC 15.247(d) and RSS-210 A8.5

**RESULT:**
**PASS**

Date of testing: 2008-02-20

Ambient temperature: 24.0 °C

Relative humidity: 24 %

Atmospheric pressure: 1010hPa

**Requirements:**

In any 100 kHz bandwidth outside the frequency band, the RF power shall be at least 20 dB below that of the maximum in-band 100 kHz emission.

**Test procedure:**

ANSI C63.4-2003, RSS-Gen 4.9 and Measurement of Digital Transmission Systems Operating under Section 15.247

A spectrum analyzer was connected to the antenna port of the transmitter. Analyzer Resolution Bandwidth was set to 100 kHz. For each channel investigated, the in-band and out-of-band emission measurements were performed. The out-of-band emissions were measured from 30 MHz to 25 GHz (10<sup>th</sup> harmonics).

The EUT was connected to a DC power supply with a voltage of 3.0V simulating a full battery.

## 6. Test Results Radiated Emissions

### 6.1.1 Band edge Radiated Emission FCC 15.247(d) and RSS- 210 A2.2

**RESULT:****Pass**

Date of testing: 2008-02-14

Ambient temperature: 22.0°C

Relative humidity: 29%

Atmospheric pressure: 1010hPa

**Requirements:**

Radiated emissions which fall in the restricted bands, as defined in Section 15.205(a) and RSS-210 2.7, must also comply with the radiated emission limits specified in Section 15.209(a) and RSS-210 2.7.

**Test procedure:**

ANSI C63.4-2003, RSS-Gen 4.9, 4.10 and Measurement of Digital Transmission Systems Operating under Section 15.247

Measurements were made in a Semi Anechoic Chamber at a measurement distance of 3m.

The EUT was placed on a nonconductive turntable 0.8 meters above the ground plane. The EUT was rotated 360°, and the antenna was raised and lowered from 1 to 4 meters in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations at 3 EUT positions (X, Y and Z).

Peak (1 MHz RBW/VBW) and average (1 MHz RBW/10 Hz VBW) radiated measurements were taken with a suitable span to encompass the peak of the fundamental. The EUT was arranged in order to maximize emissions.

The test was performed using a new battery.

The highest emission amplitudes relative to the appropriate limit were recorded in this report.

**Requirements:**

The emissions from the intentional radiator shall not exceed the field strength specified in 15.209(a) and RSS-210 2.7 and Measurement of Digital Transmission Systems Operating under Section 15.247

**Test procedure:**

ANSI C63.4-2003, RSS-Gen 4.9, 4.10 and Measurement of Digital Transmission Systems Operating under Section 15.247

Before final measurements of radiated emissions were made in Semi Anechoic Chamber, the EUT was scanned before final testing. This was done in order to determine its emissions spectrum profile. The physical arrangement of the test system and associated cabling was varied in order to determine the effect on the EUT's emissions in amplitude, direction and frequency. This process was repeated during final radiated emissions measurements, at each frequency, in order to ensure that maximum emission amplitudes were attained.

Final radiated emissions measurements were made at 3meters or 10meters. Below 1 GHz the measurement was performed at a distance of 10m. The values were recalculated accordingly using a factor of 20dB/decade. The EUT was placed on a nonconductive turntable 0.8 meters above the ground plane. The spectrum was examined from 30 MHz to the 10th harmonic of the highest fundamental transmitter frequency (25 GHz).

At each frequency, the EUT was rotated 360°, and the antenna was raised and lowered from 1 to 4 meters in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations and 3 EUT positions(X,Y, and Z). For frequencies between 30 and 1000 MHz, the spectrum analyzer's 6 dB bandwidth was set to 120 kHz, and the analyzer was operated in the CISPR quasi-peak detection mode.

For emissions above 1000 MHz, emissions are measured using following settings:

Peak: RBW=1MHz, VBW=1MHz

Average: RBW=1MHz, VBW=10Hz
